

The Business Central Health Check Checklist

12 things worth checking before you assume your BC environment just needs a bigger server.

■ Performance & Data

- **Dimensions:** Are you running more than 6-8 active dimensions per transaction, and does anyone actually use all of them in reporting?
- **SIFT indexes:** Are sum/count fields you rarely view still being maintained on high-volume tables, slowing down every post?
- **Custom extensions:** Has anyone run Page Inspection on your slowest pages to see which extension is adding the load?
- **Chart of Accounts:** How many G/L accounts have zero postings in the last 24 months?

■ Financial Controls

- **Bank reconciliation:** What percentage of transactions match automatically vs. requiring manual review each month?
- **Month-end close:** How many days does close currently take, and where does most of that time actually go?
- **Approval workflows:** Does every approver have a substitute configured for when they're out?

■ Reporting & Visibility

- **Financial Reports:** Are you still exporting the default trial balance into Excel every period?
- **Budget-to-actual:** Is your budget built with dimensional detail, or just one number per account?
- **Cash flow forecast:** Has anyone configured the native Cash Flow Forecast tool, or is this still a spreadsheet?

■ Security & Access

- **Segregation of duties:** Can any single user both create a vendor and approve a payment to it?
- **Permission sets:** Have permission set assignments been reviewed since the original implementation?

Check off fewer than 8? Your environment is likely due for an optimization review.
